

HT604L/614/692 3¹⁸ Series of Decoders

Features

- Operating voltage: 2.4V~12V
- Low power and high noise immunity CMOS technology
- Low standby current
- Capable of decoding 18 bits of information
- Pairs with Holtek's 3¹⁸ series of encoders
- 9~10 address pins
- 2~8 data pins
- Trinary address setting

Applications

- Burglar alarm system
- Smoke and fire alarm system
- Garage door controllers
- Car door controllers

General Description

The 3^{18} decoders are a series of CMOS LSIs for remote control system applications. They are paired with the 3^{18} series of encoders. For proper operation, a pair of encoder/decoder pair with the same number of address and data format should be selected (refer to the encoder/decoder cross reference tables).

The 3¹⁸ series of decoders receive serial address and data from that series of encoders that are transmitted by a carrier using an RF or an IR transmission medium. It then compares the serial input data twice continuously with its local address. If no errors or unmatched codes are

- Two times of receiving check
- Built-in oscillator needs only a 5% resistor
- Valid transmission indicator
- Easy interface with an RF or an infrared transmission medium
- Minimal external components
- Package information: refer to Selection Table
- Car alarm system
- Security system
- Cordless telephones
- Other remote control systems

encountered, the input data codes are decoded and then transferred to the output pins. The VT pin also goes high to indicate a valid transmission.

The 3^{18} decoders are capable of decoding 18 bits of information that consists of N bits of address and 18–N bits of data. To meet various applications they are arranged to provide a number of data pins whose range is from 0 to 8 and an address pin whose range is from 8 to 18. In addition, the 3^{18} decoders provide various combinations of address/data number in different packages.

Absolute Maximum Ratings

Supply Voltage0.3V to 13V	Storage Temperature– $50^{\circ}C$ to $125^{\circ}C$
Input Voltage $V_{\rm SS}$ –0.3V to V _{DD} +0.3V	Operating Temperature–20°C to 75°C

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

Functional Description

Operation

The 3¹⁸ series of decoders provide various combinations of address and data pins in different packages. It is paired with the 3¹⁸ series of encoders. The decoders receive data transmitted by the encoders and interpret the first N bits of the code period as address and the last 18-N bits as data (where N is the address code number). A signal on the DIN pin then activates the oscillator which in turns decodes the incoming address and data. The decoders will check the received address twice continuously. If all the received address codes match the contents of the decoder's local address, the 18-N bits of data are decoded to activate the output pins, and the VT pin is set high to indicate a valid transmission. That will last until the address code is incorrect or no signal has been received. The output of the VT pin is high only when the transmission is valid. Otherwise it is always low.

Output type

There are two types of output to select from:

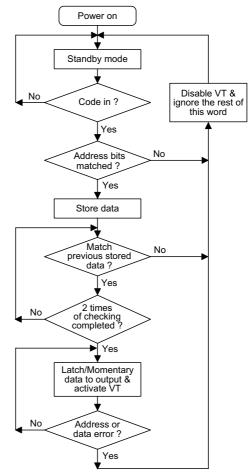

• Momentary type

The data outputs follow the encoder during a valid transmission and then reset.

• Latch type

The data outputs follow the encoder during a valid transmission, and are then latched in this state until the next valid transmission occurs.

Flowchart

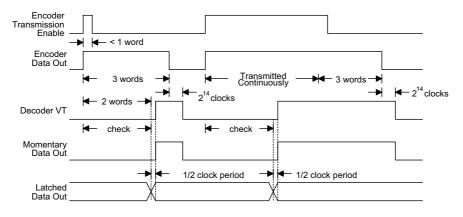

Note: The oscillator is disabled in the standby state and activated as long as a logic "high" signal is applied to the DIN pin. i.e., the DIN should be kept "low" if there is no signal input.

6

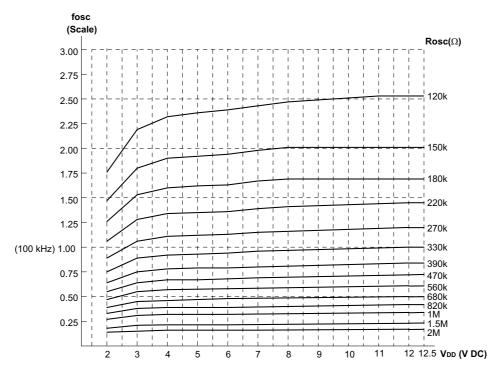

Address/Data sequence

The following provides a table of address/data sequence for various models of the 3^{18} series decoders. A correct device should be selected according to the sindividual address and data requirements.

Part No.		Address/Data Bits										
	0~3	4	5	6~9	10	11	12	13	14	15	16	17
HT604L	A0~A3	A4		A6~A9		A11	D12	D13	D14	D15		
HT614	A0~A3	A4		A6~A9		A11	D12	D13	D14	D15		
HT692	A0~A3			A6~A9		A11	A12		D14	D15		_

Note: "—" is a dummy code which is left "open" and not bonded out.

Oscillator frequency vs supply voltage

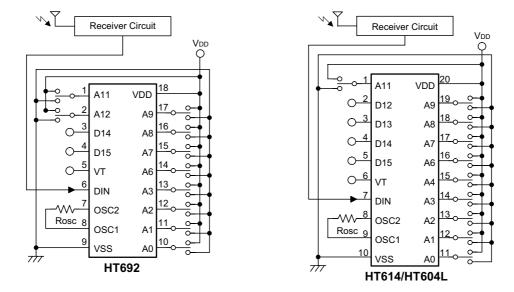

The recommended oscillator frequency is $f_{OSCD}\left(decoder\right)\cong f_{OSCE}\left(encoder\right)$
